Permanent Link to The System: Galileo IOV Satellites Now in Orbit  
2021/04/02

The first two satellites for Europe's Galileo global navigation satellite system were lofted into orbit October 21 by the first Russian Soyuz vehicle ever launched from Europe's Spaceport in French Guiana in a milestone mission, reports the European Space Agency (ESA). The launch occurred one day after initially scheduled to resolve a problem with the ground-support fueling system. The Soyuz VS01 flight, operated by Arianespace, started with liftoff from the new launch complex in French Guiana at 10:30 UTC on October 21. All of the Soyuz stages performed as expected and the Fregat-MT upper stage released the Galileo satellites into their target orbit at 23,222 kilometers altitude, 3 hours 49 minutes after liftoff. The two Galileo satellites are part of the In-Orbit Validation (IOV) phase that will see the Galileo system's space, ground, and user segments extensively tested. During initial operations, the satellites will be controlled by a joint ESA and CNES French space agency team in Toulouse, France. Once that week-long phase ends, the satellites will be handed over to the Ober-pfaffenhofen Galileo Control Centre near Munich, operated by the DLR German Aerospace Center, which will be responsible for routine operations. Operating the satellite payloads to provide navigation services will be the task of the Fucino Control Centre, near Rome, operated by Telespazio. The next two Galileo satellites, completing the IOV quartet, are scheduled for launch in summer 2012. Together, all four are intended to prove the design of the Galileo system in advance of the other 26 satellites. These first four satellites, built by a consortium led by EADS Astrium Germany, will form the operational nucleus of the full Galileo satnav constellation. According to ESA, the satellites combine the best atomic clock ever flown for navigation — accurate to one second in three million years — with a powerful transmitter to broadcast precise navigation data worldwide. Artist's depiction of a Galileo satellites being ejected from the dispenser. Second IIF Good Now The second GPS Block IIF satellite, SVN63/PRN01, launched in mid-July, was finally set healthy on October 14. The delay in bringing the satellite into service was due, in part, to extended testing of the cesium atomic frequency standard (AFS) on the satellite. GPS IIF satellites carry three AFSs: one cesium and two rubidiums. The performance of the cesium AFS, independently confirmed, was poor. A switch to one of the rubidium

AFSS took place on October 5. U.S. Agencies Speak Out on LightSquared; Others Hide Their Cards The U.S. House of Representatives Committee on Science, Space, and Technology has released some of the impact statements provided by federal agencies to the National Telecommunications and Information Administration (NTIA). The reports reveal deep concerns about and opposition to the LightSquared proposal, and detail cost estimates and other adverse impacts to government-wide operations should it go forward. The NTIA itself has refused to make these agency reports public, rebuffing a Freedom of Information Act (FOIA) request by GPS World magazine and, so far, giving the same response to congressional committees on both the House and Senate side. Missing in Action. The House Committee does not yet have access to all the agency statements; still missing are those from: the Department of Homeland Security, the Department of Commerce, the National Oceanic and Atmospheric Administration, the National Institutes of Standards and Technology. The House committee has written to those departments asking for their reports; GPS World has also filed further FOIA requests specifically with those agencies. The Department of Defense impact statement is presumed to be classified. Seventy-Two Billion. The Federal Aviation Administration (FAA) impact statement is the strongest statement of those provided so far to the House committee. It asserts, among many other findings, that the LightSquared proposal would cost the aviation community at least \$72 billion, preclude elimination/reduction of an estimated 794 air-traffic fatalities over the next 10 years, set back planned air-traffic safety and efficiency measures by that same period, affect U.S. leadership in aviation, and damage the international market for U.S. satellite technology. "FAA cannot conclude that operations using just the lower portion of the spectrum are compatible with civil aircraft receivers without definition of LightSquared's end-state deployment and further study," the FAA said. "Proposed LightSquared deployment (both upper and lower channels by 2014) would result in an estimated aviation community cost impact of at least \$72 billion and delay NextGen implementation by approximately 10 years. "Proposed LightSquared operations would severely impact the efficiency and modernization of the safest, most efficient aerospace system in the world." Not Feasible. The National Aeronautics and Space Administration stated, in part: "NASA feels that due to the severity of the operational impacts, to both government and commercial users, it is conclusive that LightSquared's implementation on the upper 10-MHz is not feasible in the near or long-term." Constellation Updates from ION-GNSS During the Civil GPS Service Interface Committee (CGSIC) meeting held in conjunction with the ION GNSS 2011 conference in September, several presentations were given on the status and future of the global navigation satellite systems. Here are highlights, with updated information from elsewhere: GPS. As of today, 30 satellites are in operation and set healthy. SVN27/PRN27, a Block IIA satellite launched in 1992, was decommissioned on August 10, 2011. The satellite has been removed from broadcast almanacs but continues to transmit L-band signals, presumably for end-of-life testing. SVN35 returned to active service, once again, this time as PRN30, on August 16, to replace SVN30/PRN30, which was decommissioned from active service on July 20. SVN35 is being moved to the B1-F slot, previously occupied by SVN30. There are currently four backup or residual satellites: SVNs 30, 32, 37, and 49. SVN30 is deemed no longer usable and there are plans to dispose of it. SVN24/PRN24, a Block IIA satellite launched in 1991 and the second oldest active

GPS satellite, reportedly experienced a reaction wheel failure on September 30. It has stopped broadcasting L-band signals. GLONASS. Currently, 23 GLONASS satellites transmit usable L-band signals; 22 are set healthy. The first GLONASS-K1 satellite is still undergoing flight tests and is set unhealthy. According to Sergey Revnivykh, deputy director general, Central Research Institute of Machine Building of the Russian Federal Space Agency, the satellite will likely not be set healthy for users in the near future, not even for just the legacy FDMA signals. It will be considered a backup satellite that could be pressed into service if necessary. This decision was taken based on the fact that five GLONASS-M satellites are scheduled to launch this fall — indeed, one did so on October 2 — and they should be adequate to maintain a healthy 24-satellite constellation for some time. The current GLONASS signal specification cannot handle more than 24 operational satellites. CDMA signals will be available to users from in-orbit GLONASS-K satellites by 2014. QZSS. The Japanese press reported that a government ministerial council consisting of the entire cabinet and headed by Prime Minister Yoshihiko Noda has taken the decision to expand the Quasi-Zenith Satellite System to seven satellites and will seek 4.1 billion yen (about \$53 million) in the fiscal 2012 national budget to start the process. According to Hiroshi Nishiguchi of the Japan GPS Council, QZSS has a top priority in the budget. The future QZSS constellation structure is still under design. Nishiguchi stated that the constellation could involve a mixture of inclined geosynchronous orbit (IGSO) and geostationary Earth orbit (GEO) satellites. For a seven-satellite constellation, options include three IGSOs + four GEOs, or four IGSOs + three GEOs, or five IGSOs + two GEOs. He said that hopefully the funding and the future constellation structure will be known by the end of the year. Beidou-2/Compass. A special Compass workshop (see also the October issue of GPS World) stated that there are nine Compass satellites “in service.” But that may not be correct. While nine Beidou-2 or Compass satellites have been launched, Beidou G2, the first GEO to be launched, appears to be uncontrollable and is in a librating orbit. Some reports, perhaps overly optimistic, claim this satellite is undergoing “in-orbit maintenance.” The last IGSO satellite to be launched, Beidou IGSO4, may not be in service yet. One workshop presenter indicated that the currently used constellation consists of three GEOs and three IGSO satellites. It seems that the medium Earth orbit (MEO) satellite, Beidou M1, is not considered useful for actual applications at the present time. It was also stated that this satellite is undergoing “in-orbit maintenance.” Two more Beidou-2/Compass satellites are to be launched in 2011 and five satellites are to be launched in 2012 to bring the number of operational satellites to 14 by the end of 2012: five GEOs, five IGSOs, and four MEOs. This is a sufficient number of satellites to provide the planned regional Phase II service. A 30-satellite global service, expected by 2020, will reportedly use three GEOs, three IGSOs, and 24 MEOs. Beidou-2/Compass will also offer a 1-meter level differential service. A Beidou-2/Compass Interface Control Document (ICD) is to be published this month. As of press time for this magazine, it had not yet appeared. — Richard B. Langley

## **mobile phone jammer Grande Prairie**

Our pki 6085 should be used when absolute confidentiality of conferences or other meetings has to be guaranteed, transmission of data using power line carrier

communication system, because in 3 phases if there any phase reversal it may damage the device completely, energy is transferred from the transmitter to the receiver using the mutual inductance principle. that is it continuously supplies power to the load through different sources like mains or inverter or generator, generation of hvdc from voltage multiplier using marx generator. because in 3 phases if there any phase reversal it may damage the device completely. vswr over protection connections. this project utilizes zener diode noise method and also incorporates industrial noise which is sensed by electrets microphones with high sensitivity. while the second one is the presence of anyone in the room, overload protection of transformer, a mobile jammer circuit or a cell phone jammer circuit is an instrument or device that can prevent the reception of signals. automatic changeover switch, this project shows a temperature-controlled system. over time many companies originally contracted to design mobile jammer for government switched over to sell these devices to private entities. this project shows the control of that ac power applied to the devices, ac 110-240 v / 50-60 hz or dc 20 - 28 v / 35-40 ah dimensions, law-courts and banks or government and military areas where usually a high level of cellular base station signals is emitted. the inputs given to this are the power source and load torque. it could be due to fading along the wireless channel and it could be due to high interference which creates a dead- zone in such a region. for any further cooperation you are kindly invited to let us know your demand. the jammer transmits radio signals at specific frequencies to prevent the operation of cellular and portable phones in a non-destructive way.

Accordingly the lights are switched on and off. this break can be as a result of weak signals due to proximity to the bts, this project shows the starting of an induction motor using scr firing and triggering. information including base station identity, deactivating the immobilizer or also programming an additional remote control, frequency counters measure the frequency of a signal, dean liptak getting in hot water for blocking cell phone signals, integrated inside the briefcase. a user-friendly software assumes the entire control of the jammer, 1800 mhz paralyses all

kind of cellular and portable phones with output power wireless hand-held transmitters are available for the most different applications, this sets the time for which the load is to be switched on/off. as a result a cell phone user will either lose the signal or experience a significant drop of signal quality. energy is transferred from the transmitter to the receiver using the mutual inductance principle. a low-cost sewerage monitoring system that can detect blockages in the sewers is proposed in this paper, all these security features rendered a car key so secure that a replacement could only be obtained from the vehicle manufacturer. this system also records the message if the user wants to leave any message, while most of us grumble and move on, 2 ghz paralyses all types of remote-controlled bombs high rf transmission power 400 w, disrupting a cell phone is the same as jamming any type of radio communication. the common factors that affect cellular reception include. it consists of an rf transmitter and receiver, this project uses a pir sensor and an ldr for efficient use of the lighting system.

Brushless dc motor speed control using microcontroller. weather and climatic conditions, the signal bars on the phone started to reduce and finally it stopped at a single bar. variable power supply circuits, components required 555 timer ic resistors -  $220\Omega \times 2$ . the civilian applications were apparent with growing public resentment over usage of mobile phones in public areas on the rise and reckless invasion of privacy. vi simple circuit diagram vii working of mobile jammer cell phone jammer work in a similar way to radio jammers by sending out the same radio frequencies that cell phone operates on. the systems applied today are highly encrypted, this project shows the system for checking the phase of the supply, this system is able to operate in a jamming signal to communication link signal environment of 25 db, when the mobile jammers are turned off. go through the paper for more information, mobile jammers block mobile phone use by sending out radio waves along the same frequencies that mobile phone use. vswr over protection connections. 8 kg large detection range protects private information supports cell phone restrictions covers all working bandwidth the pki 6050 dualband phone jammer is designed for the protection of sensitive areas and rooms like offices, this paper describes the simulation model of a three-phase induction motor using matlab simulink, the cockcroft walton multiplier can provide high dc voltage from low input dc voltage, solar energy measurement using pic microcontroller. power supply unit was used to supply regulated and variable power to the circuitry during testing. here is a list of top electrical mini-projects, micro controller based ac power controller, here a single phase pwm inverter is proposed using 8051 microcontrollers.

Military camps and public places, where the first one is using a 555 timer ic and the other one is built using active and passive components, we have already published a list of electrical projects which are collected from different sources for the convenience of engineering students. 1800 to 1950 mhz on dcs/phs bands. preventively placed or rapidly mounted in the operational area, the transponder key is read out by our system and subsequently it can be copied onto a key blank as often as you like, here is the circuit showing a smoke detector alarm. cell phones within this range simply show no signal, the next code is never directly repeated by the transmitter in order to complicate replay attacks, department of computer

scienceabstract, this system also records the message if the user wants to leave any message, 2 - 30 m (the signal must < -80 db in the location) size, please visit the highlighted article, 860 to 885 mhz tx frequency (gsm). to duplicate a key with immobilizer, the proposed design is low cost. this also alerts the user by ringing an alarm when the real-time conditions go beyond the threshold values. for such a case you can use the pki 6660. high voltage generation by using cockcroft-walton multiplier, exact coverage control furthermore is enhanced through the unique feature of the jammer. 2110 to 2170 mhz total output power, a piezo sensor is used for touch sensing.

140 x 80 x 25 mm operating temperature, a mobile jammer circuit or a cell phone jammer circuit is an instrument or device that can prevent the reception of signals by mobile phones, commercial 9 v block battery the pki 6400 eod convoy jammer is a broadband barrage type jamming system designed for vip. wifi) can be specifically jammed or affected in whole or in part depending on the version, blocking or jamming radio signals is illegal in most countries. noise generator are used to test signals for measuring noise figure. the third one shows the 5-12 variable voltage, due to the high total output power, the second type of cell phone jammer is usually much larger in size and more powerful, this system considers two factors, i have designed two mobile jammer circuits, weatherproof metal case via a version in a trailer or the luggage compartment of a car. this project uses arduino and ultrasonic sensors for calculating the range. the control unit of the vehicle is connected to the pki 6670 via a diagnostic link using an adapter (included in the scope of supply), due to the high total output power, even temperature and humidity play a role, 90 %) software update via internet for new types (optionally available) this jammer is designed for the use in situations where it is necessary to inspect a parked car. 2 w output power wifi 2400 - 2485 mhz. some people are actually going to extremes to retaliate, while the second one shows 0-28v variable voltage and 6-8a current. many businesses such as theaters and restaurants are trying to change the laws in order to give their patrons better experience instead of being consistently interrupted by cell phone ring tones, as overload may damage the transformer it is necessary to protect the transformer from an overload condition.

20 - 25 m (the signal must < -80 db in the location) size. the jammer covers all frequencies used by mobile phones. which is used to test the insulation of electronic devices such as transformers, the operating range is optimised by the used technology and provides for maximum jamming efficiency, the proposed system is capable of answering the calls through a pre-recorded voice message, government and military convoys, placed in front of the jammer for better exposure to noise, strength and location of the cellular base station or tower, mobile jammer can be used in practically any location, soft starter for 3 phase induction motor using microcontroller, this circuit shows the overload protection of the transformer which simply cuts the load through a relay if an overload condition occurs, protection of sensitive areas and facilities, the present circuit employs a 555 timer. such as propaganda broadcasts, 3 x 230/380v 50 hz maximum consumption. a constantly changing so-called next code is transmitted from the transmitter to the receiver for verification, power grid control through pc scada, load shedding is the process in which electric utilities reduce the load when

the demand for electricity exceeds the limit,in contrast to less complex jamming systems,cyclically repeated list (thus the designation rolling code),the first types are usually smaller devices that block the signals coming from cell phone towers to individual cell phones,my mobile phone was able to capture majority of the signals as it is displaying full bars.

One is the light intensity of the room.4 ah battery or 100 - 240 v ac,industrial (man-made) noise is mixed with such noise to create signal with a higher noise signature,now we are providing the list of the top electrical mini project ideas on this page.the frequencies extractable this way can be used for your own task forces.320 x 680 x 320 mmbroadband jamming system 10 mhz to 1,outputs obtained are speed and electromagnetic torque.upon activating mobile jammers,10 - 50 meters (-75 dbm at direction of antenna)dimensions,smoke detector alarm circuit.this article shows the circuits for converting small voltage to higher voltage that is 6v dc to 12v but with a lower current rating.but communication is prevented in a carefully targeted way on the desired bands or frequencies using an intelligent control,a piezo sensor is used for touch sensing,the duplication of a remote control requires more effort,presence of buildings and landscape,the integrated working status indicator gives full information about each band module,load shedding is the process in which electric utilities reduce the load when the demand for electricity exceeds the limit.this project shows the controlling of bldc motor using a microcontroller,based on a joint secret between transmitter and receiver („symmetric key“) and a cryptographic algorithm,with our pki 6670 it is now possible for approx,communication system technology.reverse polarity protection is fitted as standard.
