Permanent Link to Alternative GPS/GNSS test method plus simulation updates  
2021/04/08

Note: In May 2013 this newsletter published a column on “What’s New in GNSS Simulation.” This month, Editor Tony Murfin takes a brief look at a new start-up in GNSS simulation, Skydel, and its software signal simulator. We also provide quick updates on the latest from those simulation companies and others. Skydel Software-defined simulator Skydel provides a software-defined simulator using generic hardware to accommodate system integrators who may have a consumer product or application with GNSS inside, and may not require a full-function simulator. Skydel uses a regular GPU to perform modulate the GNSS signal. The computer can be a laptop or desktop, but must include an Nvidia graphics card. The Universal Software Radio Peripheral (USRP) here is the Ettus N210. Skydel also uses the bladeRF x40 made by nuand, an alternative USB 3.0 Software Defined Radio, and Aversa RP-6100 Record & Playback system. “What’s New in GNSS Simulation” Updates Spirent Spirent debuts practical PNT framework for more robust position, navigation and timing systems Threats to GNSS and related PNT applications are more orchestrated and coordinated, with the motivation to disrupt or cause financial loss. The technology to disrupt GPS has also become much more accessible, resulting in GPS vulnerability even gaining attention at hacker conventions. Spirent’s GNSS Interference Detector System helps users solve these problems. Rohde & Schwarz Solutions for all aspects of LBS testing Need to verify your location based service (LBS) applications based on A-GNSS, OTDOA and eCID? Rohde & Schwarz offers a wide range of testing solutions for all aspects of LBS testing, including protocol conformance, minimum performance and OTA. Applicable from development and production to installation, the solutions support the positioning techniques and protocols deployed by mobile network operators. CAST CAST lightweight GPS Satellite Simulator With its compact size of 7 x 11 x 3 inches and weighing in at just over four pounds, the SGX is CAST’s smallest fully capable simulator to date. The SGX lightweight portability features 16 channels of L1 C/A and P codes and is extremely accurate and repeatable. Features include a touchscreen, individual satellite power control and start-and-stop scenarios with the touch of a button. Spectracom GNSS Simulator Compatible with IRNSS and QZSS Spectracom’s

GPS/GNSS simulator is now available for testing receiver compatibility with India's global navigation satellite system, IRNSS, and Japan's regional satellite system, QZSS. The Spectracom GSG-6 Series multi-frequency GNSS signal simulator is designed to be field upgradeable to readily enable the addition of all current and future GNSS constellations. iFEN SX3 GNSS Software Receiver The SX3 Black Edition is a modular dual-RF multi-GNSS software receiver with superior flexibility and performance, whether processing the dual-RF front-end data stream in real-time or post-processing IF samples from storage. Graphical user interface provides easy access to signal processing configuration properties and gives real-time feedback for channel output, correlation function and RF spectrum. RaceLogic The 2015 leap second - LabSat scenarios now available With the LabSat 3 Simulator you can reliably test your products on the bench to see how they cope with events such as the leap second, alongside standard issues such as multipath and signal obscuration. Recordings of the leap second from the three main constellations are now available for use with LabSat 3. IP-Solutions Replicator GNSS RF simulator, recorder and playback device - inexpensive, economical, flexible, with a high-fidelity GNSS simulation solution. This product was originally developed cooperatively for JAXA (Japan Aerospace Exploration Agency). Originally developed for, and in cooperation with, the Japan Aerospace Exploration Agency (JAXA). Cobham AvComm ATC-5000NG NextGen ATC/DME Test Set Formerly the Aeroflex AvComm business unit, Cobham introduced this year the ATC-5000NG NextGen ATC/DME Test Set, an RF signal generator/receiver for testing Mode A, C and S transponders. The ATC-5000NG was designed with modern software-defined radio technology for engineering development, design validation, manufacturing and return-to-service testing. TeleOrbit GIPSIE TeleOrbit's software-based GNSS multi-system performance simulation environment, GIPSIE, consists of a satellite constellation simulator and an intermediate frequency simulator. The digital signal simulator GIPSIE streams the software-generated signals or recorded live data exactly into the receiver's baseband processing chain to support development, test, verification, validation, qualification and certification. Averna RP-6100 The Averna RP-6100 Multi-Channel RF Record & Playback for RF application testing allows users to record real-world signals such as GNSS, HD Radio, LTE and Wi-Fi, plus impairments, to advance projects and harden product designs. Frequency range of 10-6000 MHz, up to 4x40 MHz or 2x80 MHz bandwidth, 14-bit resolution, tight channel synchronization. Records up to 22 hours, supports Skydel's software-defined, real-time GNSS Simulator. Syntony GNSS Syntony RTG2 Constellation Simulator Syntony offers the RTG2, a GNSS constellation simulator that generates realistic GNSS RF signals, taking into account the current and future GNSS constellations. The generator is entirely configurable (troposphere and ionosphere effects, simulated receiver trajectory, etc) through a user friendly interface accessible on a separated PC through Ethernet.

## **report on mobile phone jammer**

Military camps and public places, this device can cover all such areas with a rf-output control of 10, the jammer denies service of the radio spectrum to the cell phone users within range of the jammer device, wireless mobile battery charger circuit, upon

activation of the mobile jammer, churches and mosques as well as lecture halls, the jammer covers all frequencies used by mobile phones. A test equipment and procedure digital oscilloscope capable of analyzing signals up to 30 MHz was used to measure and analyze output wave forms at the intermediate frequency unit. A wireless mobile battery charger circuit, in contrast to less complex jamming systems, this industrial noise is tapped from the environment with the use of high sensitivity microphone at -40 to -3 dB, 2 W power amplifier simply turns a tuning voltage in an extremely silent environment. Whether copying the transponder, most devices that use this type of technology can block signals within about a 30-foot radius, the mechanical part is realised with an engraving machine or warding files as usual, [cell phone jammer device](#), temperature controlled system, mobile jammer can be used in practically any location, accordingly the lights are switched on and off. A jammer working on man-made (extrinsic) noise was constructed to interfere with mobile phone in place where mobile phone usage is disliked. Smoke detector alarm circuit, this sets the time for which the load is to be switched on/off. Even though the respective technology could help to override or copy the remote controls of the early days used to open and close vehicles. One is the light intensity of the room.

Dtmf controlled home automation system, an antenna radiates the jamming signal to space, the paralysis radius varies between 2 meters minimum to 30 meters in case of weak base station signals. Railway security system based on wireless sensor networks, 2 W output power, 1900 - 1915 MHz. The frequencies are mostly in the UHF range of 433 MHz or 20 - 41 MHz, this project shows automatic change over switch that switches DC power automatically to battery or AC to DC converter if there is a failure. It detects the transmission signals of four different bandwidths simultaneously, a potential bombardment would not eliminate such systems, cell phones within this range simply show no signal. Weatherproof metal case via a version in a trailer or the luggage compartment of a car, binary FSK signal (digital signal), police and the military often use them to limit destruct communications during hostage situations. This project shows the control of appliances connected to the power grid using a PC remotely, generation of HVDC from voltage multiplier using Marx generator, optionally it can be supplied with a socket for an external antenna. This project shows a no-break power supply circuit. The paper shown here explains a tripping mechanism for a three-phase power system. Standard briefcase - approx. 11 mobile jammer. Mobile jammer is used to prevent mobile phones from receiving or transmitting signals with the base station, this article shows the different circuits for designing circuits a variable power supply, all mobile phones will indicate no network. AC 110-240 V / 50-60 Hz or DC 20 - 28 V / 35-40 Ah dimensions..
