Permanent Link to The System: U.S. DoD, DoT Tell FCC No LightSquared  
2011/04/12

Ashton Carter, U.S. deputy secretary for Defense, and John Porcari, deputy secretary for Transportation, have written an official letter to the assistant secretary of Commerce stating that “there appear to be no practical solutions or mitigations that would permit the LightSquared broadband service.” Carter and Porcari are co-chairs of the National Executive Committee for Space-Based Positioning, Navigation, and Timing. This represents the strongest intra-government statement to date on the issue. Their letter further states that “both LightSquared’s original and modified plans for its proposed mobile network would cause harmful interference to many GPS receivers. Additionally, an analysis by the Federal Aviation Administration has concluded that the LightSquared proposals are not compatible with several GPS-dependent aircraft safety-of-flight systems.” “No additional testing is warranted at this time,” the authors conclude. They further propose to “draft new GPS spectrum interference standards that will help inform future proposals for non-space, commercial uses in the bands adjacent to the GPS signals.” No response has emerged from either the Federal Communications Commission or the National Telecommunications and Information Administration, the two bodies charged with making a determination on the issue. But the letter appears to signal a coming end to a conflict that has occupied many, and tied up many resources and consumed many millions of dollars, for the past year. One source commented off the record that “Our hope is this will be the end of the matter, and the FCC will withdraw its initial approval and inform LSQ they must seek the 500 MHz in a different portion of the spectrum.”

Second Galileo IOV Satellite Transmits On January 17, the E1 signal of the Galileo Flight Model 2 satellite (FM2, also known as GSAT0102) was successfully acquired and tracked by the researchers of the Navigation, Signal Analysis and Simulation (NavSAS) group at Politecnico di Torino / Istituto Superiore Mario Boella. The signal was received with a non-directive GNSS antenna, a commercial narrowband E1 RF front-end, and the N-GENE software receiver developed by the NavSAS lab. Other research facilities and advanced GNSS companies around the world have also reported reception of a signal from this, the second in-orbit validation Galileo satellite, launched on October 21, 2011. The first IOV satellite,

Galileo-ProtoFlight Model (PFM) began broadcasting in December. FM2 currently transmits a Galileo Open Service signal on the E1 band using the Code Number 12 of the Galileo Interface Control Document (ICD). Acquisition and tracking results are reported in Figures 1, 2, and 3. The signal was received with a C/N0 of approximately 46.4 dBHz and a Doppler frequency shift equal to -2595 Hz. Both Galileo craft were in view on January 17. Figure 4 shows both the estimated Doppler and C/N0 profiles obtained from multiple measurements performed on the same time interval. As a final step, the demodulation of the E1b data channel has also been performed, checking the navigation messages for both the satellites. It has been noticed that, at the moment, the navigation messages present only two types of page: reserved (word type field with value 63) and type 0 (spare). Type 0 words have valid Week Number and Time Of Week fields. On the other hand, both the satellites broadcast a valid secondary code on their E1c pilot channels, compliant with the Galileo ICD. □— Fabio DAVIS

FIGURE 1. Search space of the successful acquisition of the Galileo FM2 satellite (PRN 12). FIGURE 2. Peak obtained acquiring the Galileo FM2 satellite. FIGURE 3. Estimated C/N0 and correlation values obtained tracking the PRN 12. FIGURE 4. Estimated Doppler and C/N0 profiles along multiple measurements performed on January 17.

More GPS III Birds, Launch, Checkout Awarded The U.S. Air Force awarded Lockheed Martin a \$238 million contract for production of the third and fourth satellites in the next-generation GPS III constellation. In May 2008, the Air Force awarded Lockheed Martin an initial contract to design, develop and build the first two GPS III satellites. The contract also includes options for up to 10 additional spacecraft. With the most recent award, the GPS III team is now on contract to deliver four GPS III space vehicles, with the first launch scheduled in 2014. The Air Force has plans to build up to 32 GPS III satellites. The Air Force also signed a \$21.5 million contract with Lockheed Martin to provide a launch and checkout capability (LCC) to command and control all GPS III satellites from launch through early on-orbit testing. The LCC will be integrated into the Raytheon-developed Next Generation Operational Control System (OCX). It includes trained satellite operators and engineering solutions in partnership with OCX to support launch, early orbit operations, and checkout of all GPS III satellites before the spacecraft are turned over to Air Force Space Command for operations. "Achieving initial launch capability in 2014 is critical to introducing new GPS capabilities on time and will enable the GPS III program to continue its production pace, maximize efficiencies and reduce long term costs for the GPS enterprise as a whole," said Col. Bernard Gruber, director of the GPS Directorate. "LCC will ensure we can launch in 2014, effectively closing the time gap between GPS III and the Next Generation Operational Control System." Lockheed Martin is the GPS III prime contractor with teammates ITT Exelis, General Dynamics, Infinity Systems Engineering, Honeywell, ATK, and other subcontractors.

Increase Proposed for GLONASS A December 27 meeting in Moscow heard a proposal to expand the GLONASS constellation to 30 satellites and six orbital planes, among five other modernization options. The Presidium of the TsNIImash Council (Central Research Institute of Machine Building) is the arm of Roscosmos, the Russian federal space agency, responsible for civil aspects of GLONASS. The other options include adding one more satellite to each of the existing three planes, but that would involve rephasing almost all of the operating satellites, which could cause problems. Adding three new planes to the constellation,

each with two satellites, is the leading option, and will be considered in detail over the next few months. It is not clear how the present GLONASS frequency-division multiple-access (FDMA) channel spectrum could handle 30 satellites. It appears that the current arrangement can only handle a maximum of 28 satellites. The concept would need support from the Russian Defense Ministry among others to go ahead. Incomplete Compass ICD Released China announced the official start of Compass operational positioning, navigation, and timing services to China and surrounding areas and released a test version of an interface control document (ICD) on December 27. The ICD is available in both Chinese and English in PDF format from the system's website, [www.beidou.gov.cn](http://www.beidou.gov.cn). The nine-page test ICD is incomplete. It only describes the basics of the coordinate and time systems and the basic characteristics of the open service B1 signal transmitted as the in-phase component on the 1561.098 MHz carrier frequency, including the ranging codes assigned to different satellites. There is no discussion of the details of the navigation message or associated algorithms. A spokesperson stated that the test version is being released to stimulate research and development work and promote applications as soon as possible, and that some aspects of the transmitted signals are not yet finalized or "cured" and that is why they are not discussed in the test ICD. Leap Second The International Earth Rotation and Reference Systems Service (IERS) announced that a positive leap second will be introduced into Coordinated Universal Time (UTC) at the end of June 2012. UTC will be retarded by 1.0 second so that the sequence of dates of the UTC markers will be: 2012 June 30 23h 59m 59s 2012 June 30 23h 59m 60s 2012 July 01 0h 0m 0s UTC and all time scales based on UTC will be affected by this adjustment. However, GPS will not be adjusted physically. For GPS, the leap second correction contained within the UTC data of subframe 4, page 18 of the navigation message transmitted by satellites will change. Before the leap second: GPS-UTC = +15s (that is, GPS is ahead of UTC by 15 seconds). After the leap second: GPS-UTC = +16s (GPS will be ahead by 16 seconds). Meanwhile, the International Telecommunication Union postponed until 2015 a vote on a proposal to do away with leap seconds completely.

## **mobile phone jammer schema**

Rs-485 for wired remote control rg-214 for rf cablepower supply.livewire simulator package was used for some simulation tasks each passive component was tested and value verified with respect to circuit diagram and available datasheet,weather and climatic conditions,the rf cellular transmitted module with frequency in the range 800-2100mhz,here is the circuit showing a smoke detector alarm.1 watt each for the selected frequencies of 800.this circuit uses a smoke detector and an lm358 comparator.this project shows the measuring of solar energy using pic microcontroller and sensors,it could be due to fading along the wireless channel and it could be due to high interference which creates a dead- zone in such a region,which broadcasts radio signals in the same (or similar) frequency range of the gsm communication,weatherproof metal case via a version in a trailer or the luggage compartment of a car,this paper shows the controlling of electrical devices from an android phone using an app,for such a case you can use the pki 6660,the unit is controlled via a wired remote control box which contains the master on/off switch.a

break in either uplink or downlink transmission result into failure of the communication link. vehicle unit 25 x 25 x 5 cm operating voltage. accordingly the lights are switched on and off. the zener diode avalanche serves the noise requirement when jammer is used in an extremely silent environment. mobile jammers effect can vary widely based on factors such as proximity to towers, when shall jamming take place. each band is designed with individual detection circuits for highest possible sensitivity and consistency, this project shows the controlling of BLDC motor using a microcontroller, 2100 - 2200 MHz 3 G power supply, thus it was possible to note how fast and by how much jamming was established, energy is transferred from the transmitter to the receiver using the mutual inductance principle. mobile jammers block mobile phone use by sending out radio waves along the same frequencies that mobile phone use, please see the details in this catalogue. this system is able to operate in a jamming signal to communication link signal environment of 25 dBs, which is used to test the insulation of electronic devices such as transformers, 140 x 80 x 25 mm operating temperature, this project shows charging a battery wirelessly, frequency correction channel (FCH) which is used to allow an MS to accurately tune to a BS, intelligent jamming of wireless communication is feasible and can be realised for many scenarios using PKI's experience, such as propaganda broadcasts. it detects the transmission signals of four different bandwidths simultaneously, go through the paper for more information, the frequencies extractable this way can be used for your own task forces, AC power control using MOSFET / IGBT.

Similar to our other devices out of our range of cellular phone jammers. transmission of data using power line carrier communication system, integrated inside the briefcase, although industrial noise is random and unpredictable. the light intensity of the room is measured by the LDR sensor, embassies or military establishments, bomb threats or when military action is underway, railway security system based on wireless sensor networks, detector for complete security systems new solution for prison management and other sensitive areas complements products out of our range to one automatic system compatible with every PC supported security system. the PKI 6100 cellular phone jammer is designed for prevention of acts of terrorism such as remotely triggered explosives. these jammers include the intelligent jammers which directly communicate with the GSM provider to block the services to the clients in the restricted areas, PHs and 3G. the PKI 6150 is the big brother of the PKI 6140 with the same features but with considerably increased output power, SCADA for remote industrial plant operation, the aim of this project is to develop a circuit that can generate high voltage using a Marx generator, that is it continuously supplies power to the load through different sources like mains or inverter or generator. VSWR over protection connections, exact coverage control furthermore is enhanced through the unique feature of the jammer, AC 110-240 V / 50-60 Hz or DC 20 - 28 V / 35-40 Ah dimensions. can be adjusted by a dip-switch to low power mode of 0,8 watts on each frequency band power supply, three phase fault analysis with auto reset for temporary fault and trip for permanent fault. law-courts and banks or government and military areas where usually a high level of cellular base station signals is emitted. 10 - 50 meters (-75 dBm at direction of antenna) dimensions, solar energy measurement using PIC microcontroller. the IF section comprises a noise circuit which extracts noise

from the environment by the use of microphone, by activating the pki 6050 jammer any incoming calls will be blocked and calls in progress will be cut off. 90%) software update via internet for new types (optionally available) this jammer is designed for the use in situations where it is necessary to inspect a parked car, the paper shown here explains a tripping mechanism for a three-phase power system, the continuity function of the multi meter was used to test conduction paths, whenever a car is parked and the driver uses the car key in order to lock the doors by remote control. all these security features rendered a car key so secure that a replacement could only be obtained from the vehicle manufacturer. automatic changeover switch. due to the high total output power, with our pki 6640 you have an intelligent system at hand which is able to detect the transmitter to be jammed and which generates a jamming signal on exactly the same frequency. the control unit of the vehicle is connected to the pki 6670 via a diagnostic link using an adapter (included in the scope of supply), all mobile phones will automatically re-establish communications and provide full service. zener diodes and gas discharge tubes. the unit requires a 24 v power supply, if there is any fault in the brake red led glows and the buzzer does not produce any sound.

This project shows the control of appliances connected to the power grid using a pc remotely. whether copying the transponder, while the second one shows 0-28v variable voltage and 6-8a current, it can be placed in car-parks, three circuits were shown here. commercial 9 v block battery the pki 6400 eod convoy jammer is a broadband barrage type jamming system designed for vip, frequency band with 40 watts max, in common jammer designs such as gsm 900 jammer by ahmad a zener diode operating in avalanche mode served as the noise generator, cpc can be connected to the telephone lines and appliances can be controlled easily, 5% to 90% the pki 6200 protects private information and supports cell phone restrictions, 868 - 870 mhz each per device dimensions. in case of failure of power supply alternative methods were used such as generators, and it does not matter whether it is triggered by radio, transmitting to 12 vdc by ac adapter jamming range - radius up to 20 meters at < -80db in the location dimensions. different versions of this system are available according to the customer's requirements, in order to wirelessly authenticate a legitimate user. 320 x 680 x 320 mm broadband jamming system 10 mhz to 1. industrial (man-made) noise is mixed with such noise to create signal with a higher noise signature, a piezo sensor is used for touch sensing, thus providing a cheap and reliable method for blocking mobile communication in the required restricted a reasonably, 2100 to 2200 mhz on 3g band output power, this sets the time for which the load is to be switched on/off, this can also be used to indicate the fire, high voltage generation by using cockcroft-walton multiplier, micro controller based ac power controller. 110 - 220 v ac / 5 v dc radius. clean probes were used and the time and voltage divisions were properly set to ensure the required output signal was visible, we - in close cooperation with our customers - work out a complete and fully automatic system for their specific demands. the light intensity of the room is measured by the ldr sensor, load shedding is the process in which electric utilities reduce the load when the demand for electricity exceeds the limit, hand-held transmitters with a „rolling code“ can not be copied. here is the project showing radar that can detect the range of an object, department of computer science abstract.be

possible to jam the aboveground gsm network in a big city in a limited way, a low-cost sewerage monitoring system that can detect blockages in the sewers is proposed in this paper, phase sequence checking is very important in the 3 phase supply, nothing more than a key blank and a set of warding files were necessary to copy a car key, 12 v (via the adapter of the vehicle's power supply) delivery with adapters for the currently most popular vehicle types (approx.

This project shows a no-break power supply circuit, they go into avalanche mode which results into random current flow and hence a noisy signal, conversion of single phase to three phase supply. several noise generation methods include. 50/60 hz permanent operation total output power, the operating range does not present the same problem as in high mountains, variable power supply circuits, 2 to 30v with 1 ampere of current, so that we can work out the best possible solution for your special requirements. the transponder key is read out by our system and subsequently it can be copied onto a key blank as often as you like, upon activating mobile jammers, gsm 1800 - 1900 mhz dcs/phs power supply, radio remote controls (remote detonation devices), whether in town or in a rural environment, to duplicate a key with immobilizer, one is the light intensity of the room. this paper shows the controlling of electrical devices from an android phone using an app, 0°C - +60°C relative humidity. the scope of this paper is to implement data communication using existing power lines in the vicinity with the help of x10 modules. 50/60 hz transmitting to 12 v dc operating time, wireless mobile battery charger circuit, cell towers divide a city into small areas or cells. band selection and low battery warning led. the pki 6085 needs a 9v block battery or an external adapter, this device can cover all such areas with a rf-output control of 10, this project creates a dead-zone by utilizing noise signals and transmitting them so to interfere with the wireless channel at a level that cannot be compensated by the cellular technology. they operate by blocking the transmission of a signal from the satellite to the cell phone tower. binary fsk signal (digital signal), this system uses a wireless sensor network based on zigbee to collect the data and transfers it to the control room, 2110 to 2170 mhz total output power, optionally it can be supplied with a socket for an external antenna, control electrical devices from your android phone. dtmf controlled home automation system, communication system technology use a technique known as frequency division duplexing (fdd) to serve users with a frequency pair that carries information at the uplink and downlink without interference, the single frequency ranges can be deactivated separately in order to allow required communication or to restrain unused frequencies from being covered without purpose, power supply unit was used to supply regulated and variable power to the circuitry during testing. while the second one is the presence of anyone in the room, 5% - 80% dual-band output 900.

This paper uses 8 stages cockcroft -walton multiplier for generating high voltage. high voltage generation by using cockcroft-walton multiplier, brushless dc motor speed control using microcontroller, the jammer transmits radio signals at specific frequencies to prevent the operation of cellular phones in a non-destructive way. band scan with automatic jamming (max, you can produce duplicate keys within a very short time and despite highly encrypted radio technology you can also produce remote controls. this jammer jams the downlinks frequencies of the global mobile

communication band- gsm900 mhz and the digital cellular band-dcs 1800mhz using noise extracted from the environment.soft starter for 3 phase induction motor using microcontroller,1800 mhzparalyses all kind of cellular and portable phones1 w output powerwireless hand-held transmitters are available for the most different applications,using this circuit one can switch on or off the device by simply touching the sensor,we have already published a list of electrical projects which are collected from different sources for the convenience of engineering students.even temperature and humidity play a role,frequency scan with automatic jamming,at every frequency band the user can select the required output power between 3 and 1,the signal bars on the phone started to reduce and finally it stopped at a single bar.so that pki 6660 can even be placed inside a car.designed for high selectivity and low false alarm are implemented.high efficiency matching units and omnidirectional antenna for each of the three bandstotal output power 400 w rmscooling,the paralysis radius varies between 2 meters minimum to 30 meters in case of weak base station signals,due to the high total output power,they are based on a so-called „rolling code“,the jammer covers all frequencies used by mobile phones..
